

SOC ALERT INVESTIGATION & THREAT INTELLIGENCE LAB - TryHackMe

Tools Used:

- Splunk SIEM
- TryHackMe
- VirusTotal
- MITRE ATT&CK Framework
- Windows Event Logs

Description:

This project was created to simulate a real Security Operations Center (SOC) Level 1 investigation process using Splunk SIEM.

The main objective of the project was to investigate suspicious activity inside Windows event logs, identify malicious behavior, analyze attack evidence, and prepare a professional SOC incident report.

The project was completed inside the “Investigating with Splunk” room in TryHackMe. The environment contained real-world Windows log data from a compromised machine.

My responsibility during the investigation was to identify unusual events, understand attacker behavior, correlate logs, and determine whether the activity was malicious or benign.

This project helped me understand how SOC analysts investigate alerts, perform triage, analyze logs, and document incidents in enterprise environments.

Step-by-Step Investigation Process:

Step 1 — Accessing the Environment

I first logged into the TryHackMe platform and opened the “Investigating with Splunk” room. After starting the machine, I accessed the Splunk dashboard through the browser interface.

Once the Splunk environment loaded successfully, I navigated to the Search & Reporting section where all log analysis activities were performed.

Step 2 — Reviewing Available Logs

The first step of the investigation was understanding what data sources were available. I executed general search queries to review all collected logs and available event types.

Example Query Used:

index=main earliest=0

This query displayed all available logs from the environment.

I then analyzed available Event IDs using:

index=main | stats count by EventID | sort -count

The results showed several important Windows Event IDs including:

- EventID 800
- EventID 4624
- EventID 4688
- EventID 4672

From the results, EventID 800 appeared frequently, which immediately became suspicious because it represents PowerShell pipeline execution activity.

Step 3 — PowerShell Investigation

To investigate the PowerShell activity further, I filtered logs related to EventID 800.

Query Used:

index=main EventID=800

The logs showed multiple PowerShell execution events coming from the same host machine named: James.browne

During log review, I identified a suspicious PowerShell command containing the “-enc” argument.

Example:

powershell.exe -enc [Base64 Encoded Command]

The “-enc” flag is commonly used by attackers to hide malicious PowerShell scripts using Base64 encoding. This technique helps bypass detection and hide malicious commands from users and security tools.

The logs also contained:

- Encoded command execution
- Hidden PowerShell execution
- Unusual command-line activity
- Suspicious scripting behavior

This indicated possible malicious PowerShell abuse.

Step 4 — User & Host Correlation

After identifying suspicious PowerShell activity, I correlated related logs to identify the affected user and host.

The investigation identified:

- Hostname: James.browne
- User Account: Cybertees\James

I verified whether the user had logged into the machine successfully before the suspicious activity occurred.

Query Used:

index=main EventID=4624

EventID 4624 represents successful login activity.

The logs confirmed successful authentication events before the suspicious PowerShell execution.

Step 5 — Process Creation Analysis

Next, I analyzed process creation logs to identify suspicious executables launched on the system.

Query Used:

index=main EventID=4688

EventID 4688 represents process creation events.

The analysis showed suspicious process activity involving:

- powershell.exe
- cmd.exe
- encoded PowerShell execution

This confirmed that suspicious processes were executed on the affected host.

Step 6 — MITRE ATT&CK Mapping

After identifying attacker behavior, I mapped the activity to the MITRE ATT&CK framework.

Technique Identified:

T1059.001 — PowerShell

Reason:

The attacker used encoded PowerShell commands to execute suspicious scripts on the host system.

This mapping helped classify the attacker behavior using industry-standard threat intelligence techniques.

Step 7 — Threat Intelligence Validation

To validate the investigation findings, I used VirusTotal to check suspicious indicators.

The suspicious command behavior and PowerShell activity matched known malicious patterns commonly associated with malware execution and attacker persistence techniques.

Step 8 — Incident Documentation

Finally, I created a structured SOC incident report documenting:

- Timeline of events
- Suspicious indicators
- Investigation findings

- MITRE mapping
- Severity classification
- Recommended remediation actions

Incident Report

Incident Title:

Suspicious Encoded PowerShell Execution Detected

Severity:

High

Incident Status:

True Positive

Affected Host:

James.browne

Affected User:

Cybertees\James

MITRE ATT&CK Technique:

T1059.001 — PowerShell

Incident Summary:

During log analysis in Splunk SIEM, suspicious PowerShell activity was identified on the host "James.browne". Investigation revealed encoded PowerShell execution using the "-enc" argument, indicating possible malicious script execution.

Further analysis confirmed successful logins and suspicious process creation events related to PowerShell activity. The behavior matched known attacker techniques involving obfuscated command execution.

Evidence Collected:

- EventID 800 PowerShell logs
- Encoded command execution
- Successful login events
- Suspicious process creation logs
- PowerShell execution activity

Investigation Verdict:

True Positive — Malicious Activity Confirmed

Recommended Actions:

- Isolate affected endpoint
- Reset affected user credentials
- Block malicious PowerShell execution
- Review additional systems for similar behavior
- Escalate incident to SOC L2 Team

SCREENSHOTS

The top screenshot shows the Splunk Enterprise 'Explore Splunk' dashboard. The left sidebar contains links to 'Apps', 'Search & Reporting', 'Python Upgrade Readiness App', 'Splunk Essentials for Cloud and Enterprise 8.2', and 'Splunk Secure Gateway'. The main area has three cards: 'Add Data' (Add or forward data to Splunk), 'Splunk Apps' (Apps and add-ons extend the capabilities of Splunk), and 'Splunk Docs' (Comprehensive documentation for Splunk and for all other Splunk products). Below these cards, a message states: 'Forwarders: Instance. Forwarder Monitoring is disabled. Please go to the setup page to enable it.'

The bottom screenshot shows the 'New Search' results page. The search query is 'index=main failed OR failure'. It shows 35 events. The table below displays the first event:
